STRUCTURE

OBSERVATIONS ON THE BUILT EDGE

Where old and new meet

A reflective façade can make a street read twice: once as a physical route and again as a surface of fragments. This publication studies that visual relationship without claiming authorship of the building.

Reflection
is also
a material.

DETAIL STUDY

Reading the elevation

01 / Rhythm

Look for repeated verticals and the intervals between them. A crop can reveal the grid even when the whole building is not visible.

02 / Surface

Reflections change with the viewpoint. Keep the image credit and location context with the photograph rather than inventing a project description.

03 / Street

The edge of the building belongs to a wider scene. Leave enough context to show the relationship between the façade and the surrounding space.

The wider setting

A second view shifts from surface to street. Different scales make a publication feel like an observation, not a repeated image gallery.

Look at the edge.
Then the whole.

Architecture editorial study with credited images. It does not claim that the buildings are commissioned design work.
