This report uses authored scenario data. No real programme outcome, client engagement or audited assurance is represented.

A larger reach.
A visible gap.

2026 current results / synthetic annual scenario

18

active plots / target 20

6,200

kg sorted / target 7,000

156

unique learners / target 180

Counts describe programme outputs, not proven environmental or social impact. Baselines and definitions: pages 24-27.

Show what remains to do.

An authored chief-executive letter for the Fernloop model.

A report should make it easier to ask a useful question. Did the programme expand? Who was counted? What did the expenditure support? Which target remains out of reach? Those questions guide this edition.

Our scenario brings three kinds of work together: growing spaces, practical reuse and shared learning. Each programme has four measures, with a baseline, a current result and a target.

The figures are authored to demonstrate a reporting system. They are not evidence of an operating organisation.

The model shows progress and shortfalls together. Eighteen active plots sit against a target of twenty. Materials sorted reach 6,200 kilograms against 7,000. Learning reaches 156 unique people against 180.

The visible gap is a useful part of the page. It prevents a larger count from being read as a completed promise.

The next questions concern quality, access and continuity. More activity does not automatically establish better long-term outcomes.

Original editorial text / no real executive identity, signature or testimonial.

A boundary builds trust.

What these pages can and cannot establish.

This edition keeps the accounting boundary explicit. The authored income is GBP 160,000. Expenditure is GBP 148,000, leaving GBP 12,000 in the model. Programme budgets and expenditure appear together rather than being treated as interchangeable.

No named donor, external partner or auditor has endorsed the figures. The model does not carry a carbon conversion factor or a claim of avoided emissions.

A record of kilograms sorted is useful within its definition. It does not prove that every kilogram was ultimately recycled. A record of attendance describes visits; it does not equal unique people. A venue count does not measure every aspect of accessibility.

We have repeated those distinctions throughout the report so the limitations travel with the headline.

The leadership voice is authored for this independent portfolio publication.

All quantitative results and organisational roles are scenario content; no operating charity or accreditation is claimed.

A target needs a definition.

Each measure keeps its own unit and scale. Targets are scenario objectives. Definitions: pages 24-27.

Make space for a season.

A programme view with its limits in sight.

The growing model combines a count of active plots with participation, compost throughput and volunteer hours. Those measures describe different parts of the programme and should not be added into a single total.

Reference photograph, not a Fernloop location or activity. Natural colour retained to show the subject clearly.

See the remaining gap.

GROWING / four measures, with baseline and target.

Active plots

plots / baseline 12 / current 18 / target 20

Remaining gap 2 plots

Garden participants

unique people / baseline 80 / current 128 / target 150

Remaining gap 22 unique people

Compost processed

kg / baseline 1200 / current 2100 / target 2400

Remaining gap 300 kg

Volunteer time

hours / baseline 300 / current 480 / target 600

Remaining gap 120 hours

Bars start at zero; dark tick = baseline, lime tick = target. Each row uses its own scale. All results are synthetic.

Keep useful materials moving.

A programme view with its limits in sight.

Sorting is a first stage, not the final destination. The model records mass received into a defined sorted stream and keeps contamination visible beside that total.

Reference photograph, not a Fernloop location or activity. Natural colour retained to show the subject clearly.

See the remaining gap.

REUSE / four measures, with baseline and target.

Sorted materials

kg / baseline 4000 / current 6200 / target 7000

Remaining gap 800 kg

Contamination

percent by mass / baseline 12 / current 8 / target 6

Lower is better / gap 2 percentage points

Repair completions

items / baseline 120 / current 210 / target 240

Remaining gap 30 items

Repair workshops

sessions / baseline 8 / current 14 / target 16

Remaining gap 2 sessions

Bars start at zero; dark tick = baseline, lime tick = target. Each row uses its own scale. All results are synthetic.

A place to learn together.

A programme view with its limits in sight.

A session count says how often a programme ran. Attendance says how many visits were recorded. Unique learners describe people counted once within that programme. All three are useful; none substitutes for the others.

Reference photograph, not a Fernloop location or activity. Natural colour retained to show the subject clearly.
Karen Blakeman / Reading Repair Cafe / CC0 1.0 / reference photograph

See the remaining gap.

LEARNING / four measures, with baseline and target.

Learning sessions

Remaining gap 2 sessions

Learners reached

unique people / baseline 90 / current 156 / target 180

Remaining gap 24 unique people

Session attendance

visits / baseline 180 / current 310 / target 360

Remaining gap 50 visits

Accessible venues

venues / baseline 2 / current 4 / target 5

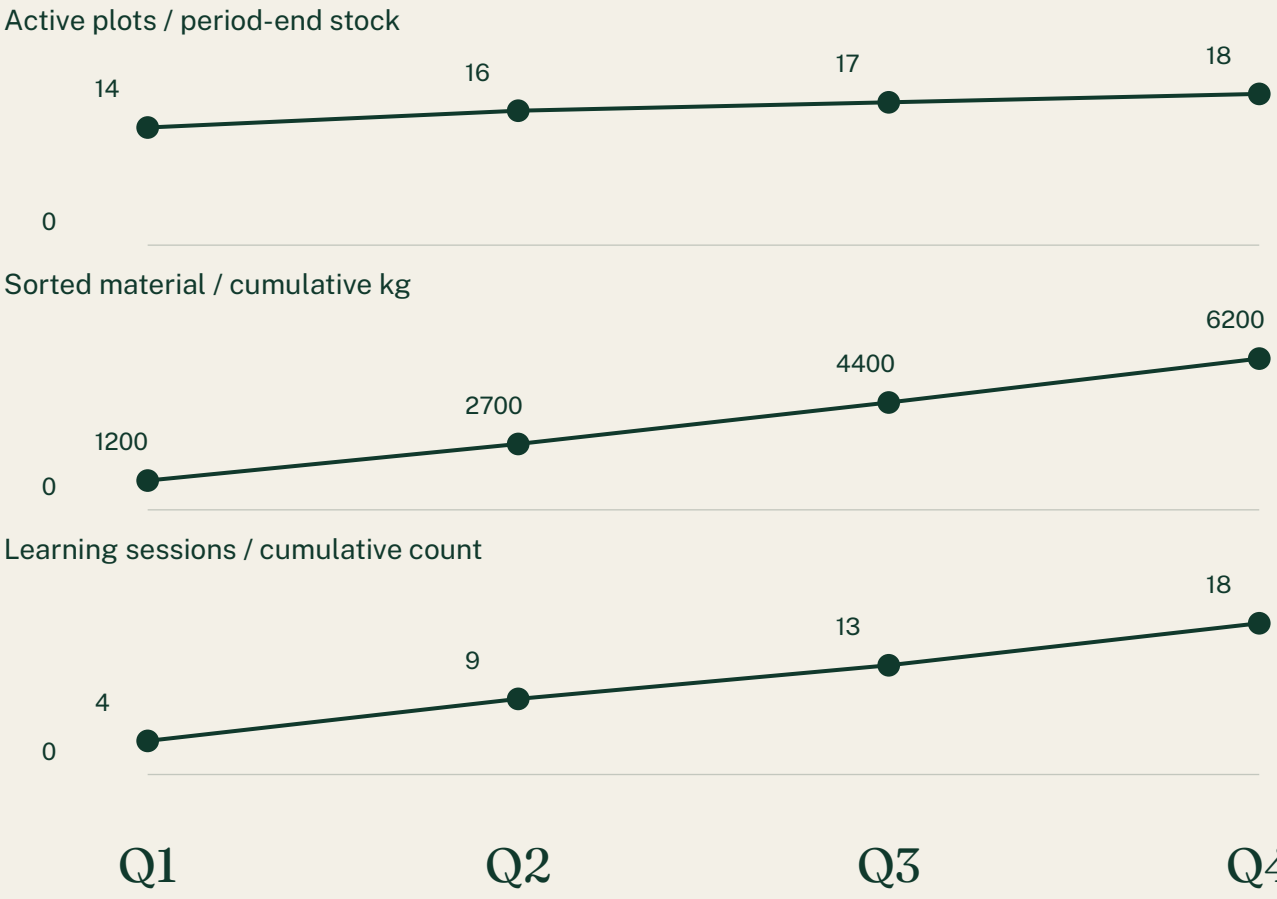

Remaining gap 1 venues

Bars start at zero; dark tick = baseline, lime tick = target. Each row uses its own scale. All results are synthetic.

Four checkpoints. One annual model.

Cumulative current-year outputs / authored scenario

14 active plots / 1200 kg sorted / 4 learning sessions

16 active plots / 2700 kg sorted / 9 learning sessions

17 active plots / 4400 kg sorted / 13 learning sessions

18 active plots / 6200 kg sorted / 18 learning sessions

Sorted mass and sessions are cumulative. Active plots are a period-end stock. Do not sum the four plot counts.

A stock is not a flow.

The period belongs beside the number.

The number of active plots is measured at each checkpoint. A plot that remains in use can appear in all four counts. Adding fourteen, sixteen, seventeen and eighteen would count the same continuing spaces repeatedly.

Sorted mass is a cumulative flow in this scenario. Its quarter-end values rise from 1,200 to 6,200 kilograms. The fourth-quarter increment is 1,800 kilograms: 6,200 minus 4,400.

Learning sessions are also cumulative. The model ends with eighteen sessions, matching the annual metric. Its quarterly increments are four, five, four and five.

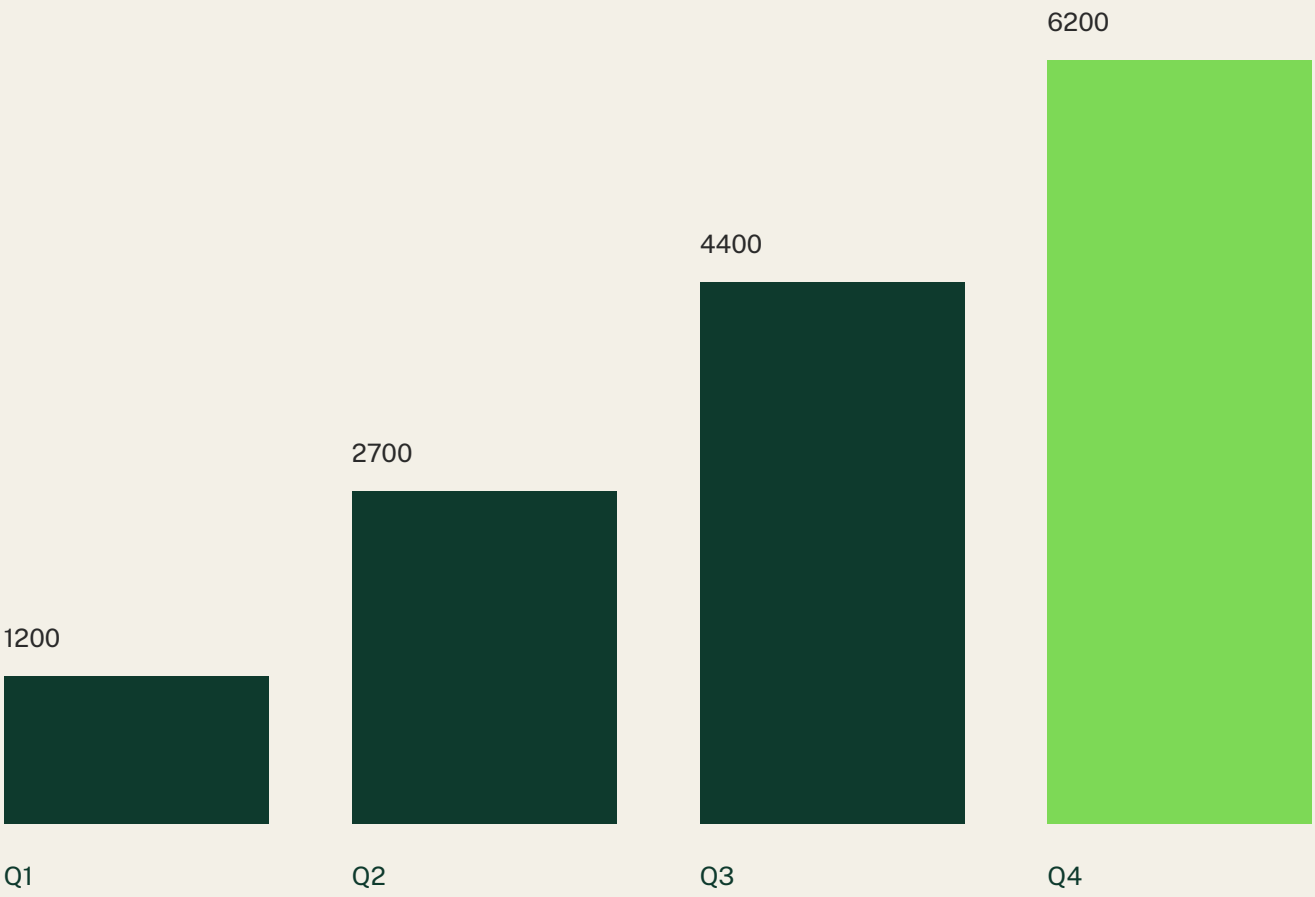

The chart on the next page keeps the cumulative series on one shared scale. This is a consistency check inside an authored model, not an observed seasonal trend or forecast.

2026 scenario checkpoints. The model has no sampled real-world time series.

The year builds in steps.

Cumulative sorted materials / kilograms / shared zero baseline

Annual target: 7,000 kg

Annual gap: 800 kg. Chart scale 0-7,000 kg. Sorting throughput is not verified recycling or avoided emissions.

Count visits and people separately.

Learning programme / authored annual scenario

310

attendance visits

156

unique learners

A learner may attend more than once. No organisation-wide unique-person total is calculated across programmes.

COMMUNITY SCENARIO / GROWING

The plot between visits.

Continuity needs a small routine.

An authored community story, not a participant interview.

Imagine a shared plot whose care is spread across several people. A short record of watering, harvest and open tasks helps the next visitor begin without guessing. The routine is modest, but it gives the space continuity between visits.

This story has no named resident, quotation or observed outcome. It is written to explain a possible programme mechanism.

The growing metrics can describe the number of active spaces and the time contributed. They cannot show whether every participant felt welcome or whether the produce changed a household budget.

Those questions would require consented participant research and a defined outcome measure. The scenario keeps the distinction visible rather than attaching an invented testimonial to a photograph.

Reference photograph / Rachel Claire. No pictured person or garden is identified as a Fernloop participant or site.

A repair starts with a decision.

An authored reuse story: identify the fault, decide whether repair is appropriate, then record what was completed. A workshop visit and a finished repair are different records.

Community scenario / no real participant quotation, client result or repair-safety endorsement.

What does completed mean?

A clear counting rule belongs in the story.

The model counts a repair completion only when the defined repair task has been finished and recorded. A person bringing an item to a workshop does not automatically create a completion. Neither does a diagnosis without a finished repair.

The current scenario has 210 completions against a target of 240. Fourteen workshops sit against a target of sixteen.

These counts do not certify that an item is safe, establish a warranty or measure how long it remained in use. Those questions need a different record and appropriate expertise.

The story offers a route through the reporting problem: define the event, record it once, retain its boundary and show the remaining gap. It does not claim to describe a real household.

Original scenario narrative. Electrical, structural and other safety-critical repairs require qualified assessment.

A compact scorecard.

Baseline 2025 / current 2026 / target 2026 / authored values

Active plots / plots

Baseline 12 / current 18 / target 20

Garden participants / unique people

Baseline 80 / current 128 / target 150

Compost processed / kg

Baseline 1200 / current 2100 / target 2400

Volunteer time / hours

Baseline 300 / current 480 / target 600

Each measure keeps its own unit. Targets are authored scenario objectives, not externally agreed commitments.

Each measure keeps its own unit. Targets are authored scenario objectives, not externally agreed commitments.

Keep the boundary with the result.

Definitions for the authored model

Growing

Active plots: distinct spaces in use at period end. Participants: unique people within Growing. Compost: kg processed, not diverted emissions. Volunteer time: logged hours.

Reuse

Sorted materials: kg in the defined sorted stream. Contamination: unwanted mass / total assessed stream mass x 100. Repairs: completed recorded tasks. Workshops: delivered sessions.

Learning

Sessions: delivered learning events. Learners: deduplicated people within Learning. Attendance: visits, including repeats. Accessible venues: venues meeting the model checklist, not certified universal access.

All data are synthetic, with no survey sample, assurance, confidence interval or causal estimate. No GRI/SDG certification claim.

Name the role before the logo.

A proposed delivery network, without claimed endorsements.

Space host

Provides agreed access, site rules and a route for raising maintenance needs.

Programme lead

Defines the activity, counting rule, safeguarding responsibilities and review date.

Funding steward

Records restricted terms, expenditure evidence and balances for the agreed period.

Review partner

Checks the method and unresolved questions; independence must be established.

No organisations are named as partners. These are proposed roles, not agreements or real funding relationships.

Every pound has a place.

GBP / original synthetic financial scenario

Grants 96000 / 60%

Donations 40000 / 25%

Earned income 24000 / 15%

PROGRAMME / BUDGET / EXPENDITURE / GBP

Growing / 64000 / 60000

Reuse / 48000 / 44000

Learning / 32000 / 30000

Support / 16000 / 14000

Opening 0 + income 160,000 - expenditure 148,000 = closing 12,000. Budgets total 160,000. No audited financial result.

Begin with a useful question.

A participation checklist for an eventual programme.

Ask which activity is open, who leads it and what preparation is needed. Confirm access needs, supervision, safeguarding and the route for raising a concern before attending.

For a growing space, ask about tools, water, shared responsibilities and seasonal commitments. For a reuse workshop, ask which items and repair tasks can be accepted.

For learning, ask about session content, cost, access and how personal information will be handled. Participation should not depend on assuming that every venue or activity meets the same needs.

This publication provides no functioning booking form, donation destination or volunteer registration. No payment, attendance or service offer is established.

Original participation prompts / no operating programme or live fundraising link.

Trace the source.
